ICS9158-01

Integrated Buffer and Motherboard Frequency Generator

General Description

The **ICS9158-01** is a low cost frequency generator designed specifically for desktop and notebook PC applications. Eight high drive, skew-controlled copies of the CPU clock are avail-able, eliminating the need for an external buffer.

Each high drive (50mA) output is capable of driving a 30pf load and has a typical duty cycle of 50/50. The CPU clock outputs are skew-controlled to within ±250ps. The CPU clocks provide all necessary frequencies for 286, 386, 486 and Pentium systems, including support for the latest speeds of processors.

The CPU clock offers the unique feature of smooth, glitch-free transitions from one frequency to the next, making this the ideal device to use whenever slowing the CPU speeds. The **ICS9158-01** makes a gradual transition between frequencies so that it meets the Intel cycle-to-cycle timing specification for 486 systems.
Features

- Eight skew-free, high drive CPU clock outputs
- Up to 100 MHz output at 5V
- ±250ps skew between CPU and 2XCPU outputs
- Outputs can drive up to 30pf load
- 50mA output drivers
- Typical 50/50 duty cycle
- Compatible with 486 and Pentium CPUs
- Glitch-free start and stop clock option
- Optional power-down mode supports Energy Star ("green") PCs
- On-chip loop filter components
- Low power, high speed 0.8μCMOS technology
- 24-pin PDIP or SOIC package

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Frequency Transitions

A key feature of the **ICS9158-01** is its ability to provide smooth, glitch-free frequency transitions on the CPU and 2XCPU clocks when the frequency select pins are changed. The frequency transition rate does not violate the Intel 486 or Pentium specification of less than 0.1% frequency change per clock period.

Using an Input Clock as a Reference

The **ICS9158-01** is designed to accept a 14.318 MHz crystal as the input reference. With some external changes, it is possible to use a crystal oscillator or other clock sources. Please see application note AAN04 for details on driving the **ICS9158-01** with a clock.

Stop Clock Feature (Optional Mask Version)

The **ICS9158-01** incorporates a unique stop clock feature compatible with static logic processors. When the stop clock pin goes low, the CPUCLK will go low after the next occurring falling edge. When STOPCLK again goes high, CPUCLK resumes on the next rising edge of the internal clock. This feature enables fast, glitch-free starts and stops of the CPUCLK and is useful in Energy Start motherboard applications.
